### **ADVANTAGES OF THE “BEAM GAS COMPRESSOR™”**

- The **BGC™** increases *cash flow and production* on existing wells.
- The **BGC™** utilizes the *pumping unit* as its prime mover and *energy source*.
- The **BGC™** moves *liquid vapors* down line with the gas and does not require a liquid dropout system during compression.
- The **BGC™** has *few moving parts* to wear out. It has *NO* gearbox or crankcase.
- The **BGC™** can be designed to operate in *H<sub>2</sub>S* and other *corrosive environments*.
- The **BGC™** is *easy to install* and the installation is simple because there are no complicated electrical controls or regulators.
- The **BGC™** is *very portable* and can be moved to other pumping wells with little effort.
- The **BGC™** has a good history of *quick payout* ranging from less than one month to one year. This depends on what your formation will give up by reducing the backpressure.
- The **BGC™** requires almost *no maintenance or adjusting*.
- The **BGC™** acts as a *shock absorber* for your rod pumping system at the point of the rod reversal.

The **BGC™** *prevents gas locking* or your downhole pump by moving the gas up the casing and away from the down hole pump resulting in increased pumping efficiency of the downhole pump.
